

FitStart App

Good vs Bad UI Design

FitStart Home Screen

What is FitStart?

FitStart is a mobile fitness app designed for all fitness levels — from beginners to experienced athletes.

- Guided workouts & personalized plans
- Progress tracking & visualizations
- Adaptive workout intensity
- Home and gym workout options

Interface Designed

Home Screen

The home screen is the central hub where users see their daily stats, start workouts, and track progress — making it the most critical interface to get right.

So, for our comparison, we chose to design a good and bad version of the home screen dashboard.

Side by side

✓ Good UI

- Consistent black and green colour scheme
- Clear visual hierarchy
- Single primary CTA
- Familiar bottom navigation
- Immediate progress feedback
- Clear icons and labels

✗ Bad UI

- No consistent colour theme and design
- Too many bright, conflicting colors
- Multiple competing call-to-actions
- Text-heavy and difficult to scan
- Unclear or missing navigation cues
- Poor font choice for a fitness app

Good UI Design

Consistency

Black background and neon green used throughout — every element follows the same brand language.

Familiarity

Standard bottom nav with recognizable icons and labels. Users immediately know how to navigate.

Clarity & Hierarchy

Greeting → workout card → stats → CTA. Information is layered from most to least important.

Efficiency

One clear primary button — 'Start Workout'. No ambiguity about what action to take next.

Bad UI Design

Inconsistency

Multiple unrelated colors (blue, orange, yellow, purple) create visual confusion and weaken the brand identity.

Poor Familiarity

Using an inappropriate font (e.g., Times New Roman) makes the app feel unprofessional and unfamiliar for a fitness context.

Broken Hierarchy

Multiple buttons such as “Start,” “Skip,” and “Schedule” compete equally, making it unclear what action the user should take.

Inefficiency

Important screen space is taken by unnecessary elements (e.g., banners or disclaimers), distracting from core functionality.

Comparing the Two Designs

Principle	Good UI	Bad UI
User Memory	Consistent colors and layout improve recognition	Inconsistent design confuses users
Learnability	Familiar navigation reduces learning effort	Unusual layout increases cognitive load
Efficiency	One clear action enables fast task completion	Multiple actions create hesitation
User Satisfaction	Clean, motivating, and trustworthy	Cluttered, frustrating, overwhelming and untrustworthy

Key Takeaways

Good design is invisible.

- **Consistency builds trust** → use a clear color system
- **Hierarchy guides users** → focus on one main action
- **Familiarity reduces learning** → follow standard patterns
- **Simplicity wins** → remove unnecessary elements
